

A favourable VMS horizon traced over a strike length of 3 km Historical shallow drilling shows widths of gossans up to 20 m Strong chargeability-magnetic anomaly indicates a second buried massive sulphide lens stratigraphically above the historical gossan outcrop zone. Deposit characteristics similar to other massive sulphide deposits in the Nubian Shield including:

- Nevsun, Bisha Deposit, Eritrea
- Tigray, Harvest Property; Ethiopia
- La Mancha, Hassai Deposit, Sudan
